

PUGET SOUND

National Estuary Program

PERRINVILLE BASIN

STORMWATER RETROFITS

A Perrinville Green Stormwater Infrastructure (GSI) Feasibility Study was completed in 2016. At least 2 recommended GSI projects from the report will be prioritized and implemented with City of Lynnwood, City of Edmonds, and local community partners.

What we're doing

At least 2 highly visible demonstration projects will be completed. City of Edmonds and Lynnwood staff will be engaged to raise familiarity across departments of GSI best practices. The broader community will also be engaged through stewardship events in the watershed.

How we're doing it

Both the City of Lynnwood and the City of Edmonds are in a transition period of full buy-in for GSI programming within their communities. This funding will serve as a valuable step towards long-term understanding, investment, and use of GSI in the Perrinville and in other priority areas throughout the 2 jurisdictions.

WHY IS THIS ISSUE IMPORTANT

The Perrinville Basin is a watershed that has been prioritized for green stormwater projects across jurisdictions as a way to reduce severe sedimentation, flooding, and fish passage issues.

WHAT YOU CAN DO

We are all working together towards Better Ground – in our homes, schools, farms, and public spaces. We can grow gardens, educate our youth, and change the world – one property at a time.

ABOUT SCD

Snohomish Conservation District's mission is to work in partnership with private landowners to address natural resource concerns. In the urban environment, SCD is leading the way in innovative, community-based stormwater projects.
